

PROCEDURE

Midazolam administration

Scope (Staff):	Community health
Scope (Area):	CACH

Child Safe Organisation Statement of Commitment

CAHS commits to being a child safe organisation by applying the National Principles for Child Safe Organisations. This is a commitment to a strong culture supported by robust policies and procedures to reduce the likelihood of harm to children and young people.

This document should be read in conjunction with this [disclaimer](#)

Aim

To outline the administration of prescribed midazolam for the emergency management of epileptic seizures.

Risk

Failure to adhere to this policy may result in medication errors and possible harm to the client.

Background

Midazolam is a water-soluble, short acting benzodiazepine used in the emergency treatment of prolonged seizures¹. It is classified as a Restricted Schedule 4 Recordable (S4R) medication and is available by prescription only¹.

Early treatment with transmucosal midazolam is used to avoid progression to, and the complications of convulsive status epilepticus (prolonged seizures)². Midazolam may be given for a seizure lasting longer than 5 minutes², or as directed by the client's doctor¹.

Any client requiring midazolam for seizures should have a health care plan that clearly outlines the administration requirements for this medication. The prescribed dose, maximum dose of midazolam to be given in a 24-hour period, and route of administration (buccal or intranasal) must have been written in the client's health care plan. The health care plan may be a Department of Education (DoE) Form 7 Seizure Management Plan (SMP) or an Epilepsy WA Plan. It should be signed by a medical practitioner or accompanied with a neurologist care plan.

Key points

- All nurses will refer to the [Nursing and Midwifery Board AHPRA Decision-making framework](#) in relation to scope of practice and delegation of care to ensure that decision-making is consistent, safe, person-centred and evidence-based.
- All nurses administering medications are required to complete the Medication Safety eLearning in accordance with the [CAHS-Community Health Practice Framework for Community Health Nurses](#).
- Community Health Nurses working in non-education support school settings who are asked to respond in a medical emergency involving a child prescribed midazolam must act as per the [School aged health services policy](#) and the [School aged health services Secondary guideline](#) in relation to a medical emergency, as well as the [Recognising And Responding To Acute Deterioration policy](#).
- The plastic, twist-top ampoules of midazolam are labelled 'for slow IV or IM injection' but are suitable for buccal and intranasal use³. The formulation is 5 mg/1 mL plastic ampoule (approximately 20 drops)^{1, 2, 4}.
- It is highly recommended **not** to use glass ampoules of midazolam.
- Community health nurses must follow the organisation's overarching infection prevention and management policies and perform hand hygiene in accordance with WA Health guidelines at all appropriate stages of the procedure.

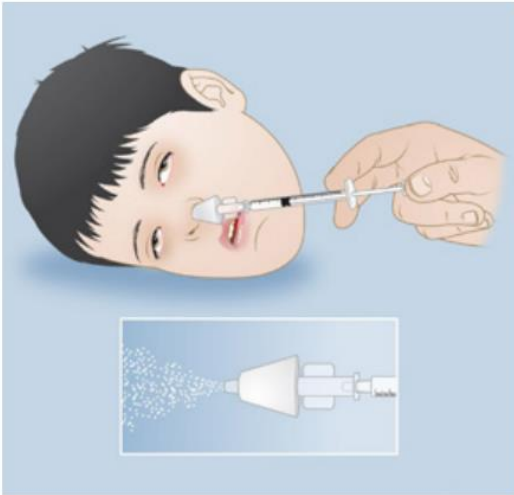

Equipment

- Midazolam plastic ampoule 5 mg/1 mL
- Mucosal Atomisation Device (MAD) – if stated in care plan
- Syringe (supplied by parent if required)
- Ampoule opener (for glass ampoules only)
- Blunt filter needle (for glass ampoules only)

Procedure

Steps	Additional Information
<p>1. Storage of midazolam</p> <ul style="list-style-type: none"> • Midazolam must be stored in a locked cupboard that is only accessible to authorised staff ¹. Refer to <i>Medication Management in Education Support Schools</i> for further information • Midazolam must be stored below 25°C and protected from light³. 	<ul style="list-style-type: none"> • When a sealed pack of midazolam is opened (and therefore exposed to light), record its opening date on the pack. • Ensure the remaining unused ampoules in the pack are protected from light by wrapping in the original foil package and/or in aluminium foil. <ul style="list-style-type: none"> ○ Midazolam ampoules must be wrapped in foil for protection from

Steps	Additional Information
	<p>light when provided to teacher/school staff for client use on school excursions.</p> <ul style="list-style-type: none"> • Dispose of any remaining plastic ampoules 8 months after opening the pack. • Midazolam in glass ampoules must be kept in its outer carton for protection from light and can be used until the expiry date on the ampoule.
<p>2. Client engagement and preparation</p> <ul style="list-style-type: none"> • Check client identity using 3 identifiers as per the CAHS Patient/Client Identification protocol. • Refer to client's health care plan for information on dosage and route of administration. • Note time that seizure started. • Check if a dose has been given prior to client's arrival at school. 	<ul style="list-style-type: none"> • Verbal clarification from the parent/caregiver when the client arrives at school or prior to dose administration ensures that midazolam is given at the recommended frequency and daily drug dose. (see Medication Management in Education Support Schools policy)
<p>3. Prepare to administer medication</p> <ul style="list-style-type: none"> • Open the plastic ampoule by twisting off the top. • If the dosage is less than the full ampoule, expel the drops that are not needed onto a tissue³ or draw up the appropriate dose in a syringe^{3, 4}. • If midazolam is dispensed in a glass ampoule, draw up the prescribed amount into a syringe. <ul style="list-style-type: none"> ○ ALWAYS use a blunt filter needle to prevent drawing up small glass particles ○ ALWAYS remove the needle before administering dose 	<ul style="list-style-type: none"> • Store syringe (if required) with the client's midazolam, along with a current copy of client's health care plan. • Once the seal on an ampoule is broken, the contents must be used immediately or discarded safely³. <p>Discard any unused midazolam.</p>
<p>4.a Buccal administration</p> <ul style="list-style-type: none"> • Lay child in recovery position, if possible³. 	<ul style="list-style-type: none"> • Ensure safety of child during seizure.

Steps	Additional Information
<ul style="list-style-type: none"> • Insert the ampoule /syringe gently between the inside of the lower cheek and the gum^{3, 4}. • Administer approximately half the dose on each side of the mouth if able¹. • Gently squeeze the ampoule/syringe to administer the dose³. 	<ul style="list-style-type: none"> • The solution is absorbed through the buccal mucosa. • In some emergency situations, unilateral administration may be undertaken. • Give 3 squeezes of the ampoule to make sure all of the dose has been given³. • Note time of dose administration. <p style="text-align: center;">Discard any unused midazolam.</p>
<p>4.b Intranasal administration</p> <ul style="list-style-type: none"> • Attach the mucosal atomiser device (MAD) to the 1 mL syringe with prescribed dose plus 0.1 mL to account for dead space in the device⁵. • Insert the MAD loosely into the client's nostril and depress the plunger to give half the prescribed dose². • Repeat the procedure in the opposite nostril to give the remaining amount of the dose. 	<ul style="list-style-type: none"> • Intranasal midazolam can be administered directly from the plastic ampoule or via a MAD¹. • The MAD device fits on the 1 mL syringe and disperses a mist into the nostrils to aid the spread of midazolam across the mucosa. • Half the dose of midazolam is administered into each nostril to optimise absorption and to lessen nasal irritation². In some emergency situations, unilateral administration of the full dose may be undertaken. • Intranasal administration may produce local irritation, stinging, and sometimes watering eyes and a runny nose². <p style="text-align: center;">Discard any unused midazolam.</p>

Steps	Additional Information
<p>5. Observation</p> <ul style="list-style-type: none"> • Place client on their side when seizure activity ceases. • Note what time the seizure stops³. • Stay with the client and continuously observe airway, breathing, circulation (ABC) and fitting activity³. • Visual observation should be undertaken by an allocated person until the client returns to their pre-sedation state. • Observe for medication side effects. 	<ul style="list-style-type: none"> • Absorption takes approximately 1–3 minutes and midazolam can take up to 10 minutes to abort the seizure. If specified on the student's Health care plan, the dose can be repeated after five minutes if the seizures persist^{2, 6}. • Common side effects of midazolam include drowsiness, headache, weakness, altered mood (giggling, hyperactivity), disorientation, confusion and altered balance^{1, 3, 4}. • Very rarely, breathing may become shallow and slower⁴. <p>Client in a wheelchair^{7, 8}:</p> <ul style="list-style-type: none"> • Leave client in wheelchair with seatbelt fastened and brakes on. • Recline backrest only – DO NOT tilt wheelchair. <ul style="list-style-type: none"> ○ NB If using a Tilt-in-Space Wheelchair, tilt seat and lock in position. • Lean client to one side to facilitate drainage of oral contents (e.g., food, vomit, saliva) as required. • Maintain open airway. • Moving the client from the wheelchair when seizure ends will depend on an assessment of the safety issues involved for both the nurse and the client.
<p>6. Ambulance considerations</p> <ul style="list-style-type: none"> • Call an ambulance: <ul style="list-style-type: none"> ○ as stated in client's health care plan ○ if clinical judgement indicates. • Complete clinical handover following iSoBAR format if client is transported by ambulance. 	<ul style="list-style-type: none"> • If breathing becomes shallow or slow, call an ambulance immediately^{3, 4} • Follow guidance in client's health care plan on the timing of second dose of midazolam and when to call an ambulance (e.g., if the seizure continues).

Steps	Additional Information
<ul style="list-style-type: none"> Inform the principal and parent/caregiver as soon as possible if an ambulance is called. 	<ul style="list-style-type: none"> If a repeat dose is not specified in the SMP, this must be interpreted as once only administration.
<p>7. Communication with family</p> <ul style="list-style-type: none"> Inform parent/caregiver about seizures, midazolam use, and whether ambulance transfer was required. 	
<p>8. Documentation</p> <ul style="list-style-type: none"> Record events, decisions, actions, outcomes, and communications accurately in client record. Record midazolam administration, using Medication chart CHS414 or DoE Form 12. 	<ul style="list-style-type: none"> Note the time seizure started, a brief description of the seizure, when midazolam was given, and when the seizure stopped³. Document midazolam administration in progress notes as per Medication management in Education Support Schools policy.
